An emulsion of perfluoroorganic compounds (PFOCs) with gas-transporting properties for intravascular administration comprises a perfluorocarbon rapidly eliminable from the organism and a perfluorinated tertiary amine slowly eliminable from the organism and further comprises at least three kinds of PFOC admixtures taken in small amounts, which are close in their structure and physicochemical properties to the main components and make up a series of PFOCs with gradually changing properties. The emulsion also contains minor admixtures of H-perfluoroalkanes. Such a composition contributes to the formation of a more homogeneous and stable non-clustered perfluorocarbon phase inside the emulsion particles. The PFOC emulsion is stabilized by a polyoxyethylene-polyoxypropylene copolymer.; The formulation of the composition provides stability of the emulsion under storage and on entry into the blood flow, as well as a low viscosity of the PFOC emulsion, which secures a high dynamic oxygen capacity of the preparation and improves the delivery of oxygen to tissues. When preparing the emulsion, the stabilizing agent is heated at a temperature of up to 75 DEG C, all the components are saturated with carbon dioxide gas, and the homogenization is carried out with feeding carbon dioxide gas, whereby the origination of peroxides is minimized and the reactogenicity is thus reduced. It is proposed to use PFOC emulsions as a means for treating air-and fat embolism, obliterating vascular injuries of extremities and poisoning with lipophilic poisons, as well as for preventing toxic injuries caused by various xenobiotics.

Tertiary perfluorocycloamines (TPFCAs) of general formula (1) <chem> where n = 1 or 2, m = 2 or 3, X is <chem> or <chem> wherein at n = 2 X is <chem> as the basis for gas transport emulsions. <?> TPFCAs comprise a group of compounds which are close in their physicochemical properties to perfluoro-N-(4-methylcyclohexyl)-piperidine, particularly in the critical temperature of dissolution in hexane, and which are used in a mixture, forming a number of compounds with gradually varying characteristics. Owing to this, a greater homogeneity of the fluorocarbon phase is achievable in the emulsions and it becomes possible to enhance the stability of the emulsion particles stabilized by an ethylene oxide-propylene oxide block copolymer, with the absence of toxicity for large animals. A mixture of TPFCAs is prepared by electrochemical fluorination of n-piperidinoheptafluorotoluene in anhydrous hydrogen fluoride. The use of this mixture of TPFCAs instead of individual perfluoro-N-(4-methylcyclohexyl)piperidine simplifies, speeds up the process for preparing perfluorinated organic compounds, makes it cheaper, and provides conditions for broader application of gas transport emulsions based thereon.

Abstract of CN 1489573 (A)

[Translate this text](#)

The inventive perfluorinated cycle-containing tertiary amines (FPCTA) of general formula (1) where n=1 or 2; m=2 or 3 x represents or, at n=2 X represents are used as a basis of gas conveying emulsions. PFCTA is a group of compounds near to perfluor-N-(4-methylcyclohexyl)-piperidine with respect to the properties thereof, in particular with respect to a critical solution temperature in hexane. Said compounds are used in a mixture, thereby producing a range of compounds which exhibit gradually changing characteristics and making it possible to obtain highly uniform fluorocarbon phases of the emulsions and to increase the stability of emulsion particles which are stabilised with the aid of ethylene oxide-propylene oxide block polymers without being toxic for small and large animals.: The PFCTA is produced by electrochemical fluorination of n-piperidine heptane fluor toluene in anhydrous hydrogen fluoride. The user of said PFCTA mixture instead of the individual perfluor-N-(4-methylcyclohexyl)-piperidine makes it possible to simplify, accelerate and lower the price of the production of perfluorinated organic compounds and extend the user of gas conveying emulsions produced on the basis thereof.

[57] ABSTRACT

A scanning method in which an object under investigation is stopped as soon as its outline is intersected by the optical axis of a fixed optical system and the outline of the object is traced out. After that, the image of the object is line-scanned within a rectangle in which the image is inscribed, while an indication that the next object has come into view is given by the equality of intersections of the object outline by the optical axis both when the object and when its image are displaced.

A scanning microscope using the above-mentioned method which has a tracing unit to trace out the outline of the object, while a limit-coordinate detector determining the extreme rectangular X- and Y-coordinates of the outline of the object "memorizes" these coordinates in the subsequent line scanning, the travel of the diaphragm of the optical microscope is limited by the extreme rectangular coordinates of the image. In the microscope, provisions are made for resetting the diaphragm to the starting position in which the outline of the object is intersected by the optical axis of the optical microscope, while an intersection counter determining how many times the diaphragm of the optical microscope intersects the outline of the object gives an unambiguous indication when the object leaves the scanned zone.

An emulsion of perfluoroorganic compounds (PFOCs) with gas-transporting properties for intravascular administration comprises a perfluorocarbon rapidly eliminable from the organism and a perfluorinated tertiary amine slowly eliminable from the organism and further comprises at least three kinds of PFOC admixtures taken in small amounts, which are close in their structure and physicochemical properties to the main components and make up a series of PFOCs with gradually changing properties. The emulsion also contains minor admixtures of H-perfluoroalkanes. Such a composition contributes to the formation of a more homogeneous and stable non-clustered perfluorocarbon phase inside the emulsion particles. The PFOC emulsion is stabilized by a polyoxyethylene-polyoxypropylene copolymer.; The formulation of the composition provides stability of the emulsion under storage and on entry into the blood flow, as well as a low viscosity of the PFOC emulsion, which secures a high dynamic oxygen capacity of the preparation and improves the delivery of oxygen to tissues. When preparing the emulsion, the stabilizing agent is heated at a temperature of up to 75 DEG C, all the components are saturated with carbon dioxide gas, and the homogenization is carried out with feeding carbon dioxide gas, whereby the origination of peroxides is minimized and the reactogenicity is thus reduced. It is proposed to use PFOC emulsions as a means for treating air-and fat embolism, obliterating vascular injuries of extremities and poisoning with lipophilic poisons, as well as for preventing toxic injuries caused by various xenobiotics.

(57) Реферат:

Заявленное изобретение относится к химико-фармацевтической промышленности и касается эмульсии перфтороганических соединений (ПФОС) для биологических и медицинских целей, содержащей смесь перфторуглеродов (ПФУ), основным компонентом которой является перфтордекалин (ПФД) и смесь перфторированных третичных аминов (ПФТА), основным компонентом которой является перфтор-N-(4-метилциклогексил)-пиперидин (ПФМЦП), имеющий меньшие, чем ПФД, скорости выведения из организма, стабилизирующий агент и физиологически приемлемый водно-солевой раствор с субстратами энергетического обмена, отличающейся тем, что все компоненты ПФОС имеют значения критической температуры растворения в гексане ($T_{крт}$), различающиеся не более чем на 2-4°C, а стабилизирующий агент представляет собой смесь блок-сополимеров из группы блок-сополимеров полиоксиэтилена-полиоксипропилена со средним массовым содержанием полиоксипропилена 20%. Изобретение также касается способа получения эмульсии и способа лечения с применением заявленной эмульсии. Эмульсии обладают высокой стабильностью и нетоксичны. 3 н. и 18 з.п. ф-лы, 5 табл., 2 ил.

Заявляемая группа изобретений относится к области биомедицины, трансфузиологии, фармакологии, биофизики, в частности к

(54) ЭМУЛЬСИЯ ПЕРФТОРОГАНИЧЕСКИХ СОЕДИНЕНИЙ ДЛЯ МЕДИЦИНСКИХ ЦЕЛЕЙ, СПОСОБ ЕЕ ПРИГОТОВЛЕНИЯ И СПОСОБЫ ЛЕЧЕНИЯ И ПРОФИЛАКТИКИ ЗАБОЛЕВАНИЙ С ЕЕ ИСПОЛЬЗОВАНИЕМ

(57) Реферат:

Эмульсия перфтороганических соединений (ПФОС) для внутрисосудистого введения состоит из быстро выводящегося перфторуглерода и медленно выводящегося перфторированного третичного амина и дополнительно содержит не менее трех видов взятых в небольших количествах примесей ПФОС. Примеси ПФОС близки по структуре и физико-химическим свойствам к основным ПФОС. Эмульсия также содержит минорные примеси Н-перфторалканов. Эмульсия ПФОС стабилизируется сополимером полиоксиэтилен-полиоксипропилена. При получении эмульсии стабилизирующий агент прогревают при температуре до 75°C, все компоненты насыщают углекислым газом и гомогенизацию выполняют при поддуве углекислого газа. Предложенный способ позволяет минимизировать появление перекисей и тем самым снизить реактогенность эмульсии. Состав композиции обуславливает стабильность эмульсии при хранении и при попадании в кровоток, а

(57) **ABSTRACT**

An emulsion of perfluoroorganic compounds (PFOC) comprises a rapidly eliminable perfluorocarbon (PFC) and a slowly eliminable perfluorinated cyclic tertiary amine, perfluoro-N-4-(methylcyclohexyl)-piperidine and additionally comprises not less than three rapidly eliminable and three slowly eliminable PFOC admixtures with the critical temperature of dissolution in hexane (CTDH) close to that of main PFOC. The PFOC emulsion is stabilized with a polyoxyethylene-polyoxypropylene copolymer having low viscosity to provide high dynamic oxygen capacity and enhancing oxygen delivery to tissues. To prepare the emulsion the stabilizing agent is heated up to 75° C., all components are saturated with carbon dioxide gas to minimize the reactogenicity in intravessel injection as a means of compensation for mass blood losses, perfusion of organs cut of blood flow, treating air-and fat embolism, obliterating vascular injuries of extremities and preventing toxic injuries caused by various xenobiotics.

(54) СПОСОБ ПОЛУЧЕНИЯ ПЕРФТОРУГЛЕРОДНЫХ ЭМУЛЬСИЙ ДЛЯ МЕДИЦИНСКИХ
ЦЕЛЕЙ

(57) Реферат:

Изобретение предназначено для получения эмульсий, способных переносить кислород и предназначаемых для использования в качестве кровезаменителей, рентгеноконтрастных средств, а также сред для сохранения изолированных органов. Задачей изобретения является получение монодисперской субмикронной эмульсии, упрощение технологии и улучшение условий стерильности процесса. В соответствии с изобретением, весь процесс проводят в замкнутом циркуляционном контуре. Сначала прокапывают смесь перфторорганических соединений через водный раствор эмульгирующего агента, затем пропускают полученную предэмulsionию попеременно через основной и дополнительный циркуляционный контур гомогенизатора, повышая давление в дополнительном контуре в 1,1 - 1,2 раза по сравнению с давлением в основном контуре. Для получения эмульсий берут смесь перфтордекалина или перфтороктилбромида и перфторметилциклогексилпиперидина в соотношении 2:1, а в качестве эмульгирующего агента используют сополимер полиоксиэтилен-полиоксипропилена. Средний размер частиц составляет от 0,06 до 0,11 мкм, доля частиц размером до 0,10 мкм достигает 85%. Эмульсия хранится при t⁰ = + 20⁰С до одного месяца, а в замороженном виде до 3-х лет. 1 з.п. ф-лы, 9 табл., 1 ил.

Изобретение относится к медицинской промышленности и касается способа получения перфторуглеродных эмульсий, способных переносить кислород и предназначенных преимущественно для использования в медицине в качестве кровезаменителей,

(57) **ABSTRACT**

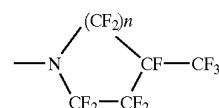

Tertiary perfluorocycloamines (TPFCAs) of general formula (1)

where n=1 or 2, m=2 or 3, X is

wherein at n=2 X is

as the basis for gas transport emulsions.

TPFCAs comprise a group of compounds which are close in their physicochemical properties to perfluoro-N-(4-methylcyclohexyl)-piperidine, particularly in the critical temperature of dissolution in hexane, and which are used in a mixture, forming a number of compounds with gradually varying characteristics. Owing to this, a greater homogeneity of the fluorocarbon phase is achievable in the emulsions and it becomes possible to enhance the stability of the emulsion particles stabilized by an ethylene oxide-propylene oxide block copolymer, with the absence of toxicity for large animals. A mixture of TPFCAs is prepared by electrochemical fluorination of n-piperidinoheptafluorotoluene in anhydrous hydrogen fluoride. The use of this mixture of TPFCAs instead of individual perfluoro-N-(4-methylcyclohexyl) piperidine simplifies, speeds up the process for preparing perfluorinated organic compounds, makes it cheaper, and provides conditions for broader application of gas transport emulsions based thereon.

(54) SCANNING METHOD AND A SCANNING MICROSCOPE

(71) We, INSTITUT BIOLOGICHESKOI FIZIKI AKADEMII NAUKSSR, of Moskovskoi oblasti, Purchino na Oke, Union of Soviet Socialist Republics, a Corporation organised and existing under the laws of the Union of Soviet Socialist Republics, do hereby declare the invention, for which we pray that a patent may be granted to us, and the method by which it is to be performed, 10 to be particularly described in and by the following statement:—

The present invention relates to scanning methods and to scanning microscopes for their realization, which are used to determine the optical and geometrical characteristics of objects, for example, in biology to construct a karyotype of chromosomes or histograms of areal distributions of objects.

According to one aspect of this invention there is provided a scanning method in which an object under investigation is moved to a starting position whereat a point in the outline of an image of the object enters the optical axis of an optical system which is fixed, the outline of an image of said object is traced, the extremal X- and Y-rectangular coordinates of the object occurring during tracing are found, the image of the object is line-scanned 20 within a rectangle having at its corners points with extremal rectangular coordinates of an image of the object and during tracing and line-scanning the optical signal of the optical system is converted to an electric signal from which the optical and geometrical characteristics of the object are evaluated.

According to another aspect there is provided apparatus for carrying out the last mentioned method which comprises a scanning microscope having an optical system which is fixed, means for moving an object under investigation to a position whereby a point in the outline of an image 45 of the object can enter the optical axis of

the optical system, means for tracing the outline of an image of said object, means for line scanning the image of the object within a rectangle having at its corners points with external rectangular coordinates 50 of an image of the object and means for converting an optical signal of the optical system to an electric signal from which the optical and geometrical characteristics of the object are evaluated.

The invention will be further described by way of example with reference to the accompanying drawings wherein:

Figure 1 is a block diagram of a scanning microscope; 60

Figure 2 is a detailed block-diagram of the same microscope;

Figure 3 is the field of vision of the scanning microscope disclosed herein, using the scanning method described, explaining 65 the search algorithm;

Figure 4 is an object bounded by a rectangle which has as its corners the points with external X and Y coordinates and within which the line scan is performed, 70 and also adjacent objects.

Referring to Figures 1 and 2, there is shown a scanning microscope, which comprises an optical microscope 1 which has a stage made up of an upper platen 2 and a lower platen 3, a diaphragm 4 arranged to lie in the plane of an image of the object 5, mounted on the top platen 2 of the stage, and a transducer 6 converting the optical signal into an electric signal carrying information about the optical and geometrical characteristics of the object 5, electrically connected to an electric signal shaper 7. The upper platen 2 and the lower platen 3 of the stage are driven by a 80 moving mechanism consisting of inching motors 8 and 9, respectively, coupled to a drive contrast unit 10.

In the scanning microscope, according to the invention, the object 5 is illuminated 90

(54) TERTIARY PERFLUOROCYCLOAMINES AS A BASIS FOR GAS TRANSPORT EMULSIONS AND PROCESS FOR PREPARING THEREOF

(57) The inventive perfluorinated cycle-containing tertiary amines (PFCTA) of general formula (1) where n=1 or 2; m=2 or 3 X represents or , at n=2 X represents are used as a basis for gas conveying emulsions. PFCTA is a group of compounds near to perfluor-N-(4-methylcyclohexyl)-piperidine with respect to the properties thereof, in particular with respect to a critical solution temperature in hexane. Said compounds are used in a mixture, thereby producing a range of compounds which exhibit gradually changing characteristics and making it possible to obtain highly uniform fluorocarbon phases of the emulsions and to increase the stability of emulsion particles which are stabilised with the aid of ethylene oxide-propylene oxide block polymers without being toxic for small and large animals. The PFCTA is produced by electrochemical fluorination of n-piperidine heptane fluor toluene in anhydrous hydrogen fluoride. The use of said PFCTA mixture instead of the individual perfluor-N-(4-methylcyclohexyl)-piperidine makes it possible to simplify, accelerate and lower the price of the production of perfluorinated organic compounds and extend the use of gas conveying emulsions produced on the basis thereof.

(54) **EMULSION OF PERFLUORORGANIC COMPOUNDS FOR MEDICAL PURPOSES, METHOD
FOR PRODUCING SAID EMULSION AND METHODS FOR CURING AND PREVENTING
DISEASES WITH THE AID OF THE EMULSION**

(57) An emulsion of perfluoroorganic compounds (PFOCs) with gas-transporting properties for intravascular administration comprises a perfluorocarbon rapidly eliminable from the organism and a perfluorinated tertiary amine slowly eliminable from the organism and further comprises at least three kinds of PFOC admixtures taken in small amounts, which are close in their structure and physicochemical properties to the main components and make up a series of PFOCs with gradually changing properties. The emulsion also contains minor admixtures of H-perfluoroalkanes. Such a composition contributes to the formation of a more homogeneous and stable non-clustered perfluorocarbon phase inside the emulsion particles. The PFOC emulsion is stabilized by a polyoxyethylene-polyoxypropylene copolymer. The formulation of the composition provides stability of the

emulsion under storage and on entry into the blood flow, as well as a low viscosity of the PFOC emulsion, which secures a high dynamic oxygen capacity of the preparation and improves the delivery of oxygen to tissues.

When preparing the emulsion, the stabilizing agent is heated at a temperature of up to 75°C, all the components are saturated with carbon dioxide gas, and the homogenization is carried out with feeding carbon dioxide gas, whereby the origination of peroxides is minimized and the reactogenicity is thus reduced.

It is proposed to use PFOC emulsions as a means for treating air-and fat embolism, obliterating vascular injuries of extremities and poisoning with lipophilic poisons, as well as for preventing toxic injuries caused by various xenobiotics.

(54) Title: **PERFLUORONATED CYCLE-CONTAINING TERTIARY AMINES USED AS A BASIS FOR GAS-CONVEYING EMULSIONS AND DEVICE FOR THE PRODUCTION THEREOF.**

(57) Resumen

Perfluorocicloaminas terciarias (TPFCA) de la formula general (I) (ver formula I) donde n = 1 o 2, m = 2 o 3, X es (ver formula) o en donde n = 2 X es (ver formula) como la base para emulsiones de transporte de gas. Las TPFCA comprenden un grupo de compuestos que estan cercanos en sus propiedades fisicoquimicas a la perfluro-N-(4-metilciclohexil)-piperidina, particularmente en la temperatura critica de disolucion en hexano, y que se usan en una mezcla, que forman varios compuestos con caracteristicas gradualmente variables. Debido a esto, se puede lograr una mayor homogeneidad de la fase de fluorocarburo en las emulsiones y llega a ser posible mejorar la estabilidad de las particulas de la emulsion estabilizadas por un copolimero de bloques de oxido de etileno-oxido de propileno, con la ausencia de toxicidad para animales grandes, se prepara una mezcla de TPFCA Por fluoracion electroquimica de n-piperidinoheptafluorotolueno en fluoruro de hidrogeno anhidro. El uso de esta mezcla de TPFCA en lugar de la perfluro-N-(4-metil-ciclohexil)-piperidina individual simplifica y acelera el proceso para preparar compuestos organicos perfluorados, lo hace mas barato y proporciona condiciones para la aplicacion mas amplia de emulsiones de transporte de gas basadas en las misma.

(57) Abstract

The inventive perfluorinated cycle-containing tertiary amines (PFCTA) of general formula (1) where n=1 or 2; m=2 or 3 X represents or , at n=2 X represents are used as a basis for gas conveying emulsions. PFCTA is a group of compounds near to perfluor-N-(4-methylcyclohexyl)-piperidine with respect to the properties thereof, in particular with respect to a critical solution temperature in hexane. Said compounds are used in a mixture, thereby producing a range of compounds
